How to create a topic

Apache Pulsar is a distributed messaging system that supports high performance and low latency. Topics are the primary way to structure data in Apache Pulsar. A Pulsar topic is a unit of storage that organizes messages into a stream. Each message in a topic has an offset, which uniquely identifies the message within the topic.

Prerequisites

Publish to partitioned topics

Create a topic

1. Create `test-topic` with 4 partitions in the namespace `apache/pulsar`.

   ```
   1   bin/pulsar-admin topics create-partitioned-topic apache/pulsar/test-topic -p
   4
   ```

2. List all the partitioned topics in the namespace `apache/pulsar`.

   ```
   1   bin/pulsar-admin topics list-partitioned-topics apache/pulsar
   ```

Related Topics

- Set up a tenant
- Create a namespace
- Produce and consume messages
